

Sensor-based funny Graphics

Aleksandr Volkov, Vladimir Dmitriev, Konstantin Kirpichenok

Department of Computer Science, Petrozavodsk State University, Russia

This project develops a simple graphical editor for Nokia N900 device. Its user draws by changing the position of the device in space (internal accelerometer is used). As a result, funny pictures can be produced.

The editor supports basic drawing operations like changing color, washout, and zoom. The drawing functions can be also controlled via finger-touch GUI.
